Main data manipulation:

- Sorted by academic year followed by income bracket to notice some patterns.
- Found many people apply as a group somehow.
- Added a column that averages the total money for those that applied as a group.
- Added a column that attempts to contextualize the money with respect to FTE or the number of full-time student equivalents.

Pivot Tables:

- Pivot Table 2 captures the data concerned with the average money received per student.
- Initially filtered out all grouped applicants but that doesn't leave too many people left compared to the whole.
- The data was special pasted into sheet 1 and rearranged such that datawrapper can use it.
- The filter was removed and the current state of pivot table 2 was special pasted to sheet 2.
- The data was copied and rearranged in sheet 2 to prepare it for datawrapper.
- Pivot table 3 was created to find where students attended in 2021, as post covid was most important.
- The data was special pasted to sheet 3 to then copy into datawrapper.
